

MARTINGALE SOLUTION TO EQUATIONS FOR SECOND GRADE FLUIDS DRIVEN BY RANDOM FORCE OF LÉVY TYPE

PAUL RAZAFIMANDIMBY (JOINT WORK WITH ERIKA HAUSENBLAS AND MAMADOU SANGO)

We study a system of nonlinear non-parabolic stochastic evolution equations driven by random forces. This system describes the motion of second grade fluids driven by random force of Lévy type. Global existence of a martingale solution is proved under general conditions on the noise.
