Robust consumption-investment problem over infinite horizon

Dariusz Zawisza

Jagiellonian University in Krakow

June 15, 2013

Introduction

• The aim of the investor is to maximize total expected discounted utility of consumption.

Literature:

Karatzas et al (1989), Fleming and Hernandez (2003), Fleming and Pang (2004), Hata and Sheu (2013)

• The investor believes that model is misspecified and he tries to protect against the worst scenario (the worst model) by looking for robust investment and consumption. Literature:

Schied (2008), Trojani and Vanini (2004), Hansen et al (2006), Gagliardini et al (2009), Faria and Coreia-da-Silva (2012)

Overview

Smooth solution to the resulting HJB

4 Final result

▲□▶ ▲□▶ ▲目▶ ▲目▶ 目 のへで

Financial market-reference model

A bank account

$$dS_t^0 = r(Y_t)S_t^0 dt,$$

An asset

$$dS_t = b(Y_t) dt + \sigma(Y_t) dB_t^1,$$

Market price of risk: $\lambda(y) = \frac{b(y) - r(y)}{\sigma(y)}$

A non-tradable economic factor

$$dY_t = g(Y_t) dt + a(Y_t) \left(\rho \ dB_t^1 + \sqrt{1-\rho^2} \ dB_t^2\right).$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Robust portfolio optimization (finite horizon)

- Model risk is described by a set of probability measures ${\cal Q}$
- The investor tries to maximize a functional

$$X o \inf_{Q \in \mathcal{Q}} \mathbb{E}^{Q} U(X),$$

where U is a utility function and X is a terminal wealth.

(日) (日) (日) (日) (日) (日) (日)

Model misspecification - finite horizon

To describe model uncertainty many authors use

$$\mathcal{Q} := \bigg\{ \mathbf{Q} \sim \mathbf{P} \mid \frac{d\mathbf{Q}}{d\mathbf{P}} = \mathcal{E} \bigg(\int \eta_{1,t} d\mathbf{B}_t^1 + \eta_{2,t} d\mathbf{B}_t^2 \bigg)_T \quad (\eta_1, \eta_2) \in \mathcal{M} \bigg\},$$

where $\mathcal{E}(\cdot)_T$ denotes the Doleans-Dade exponential \mathcal{M} denotes the set of all progressively measurable processes $\eta = (\eta_1, \eta_2)$ taking values in a fixed compact convex set $\Gamma \subset \mathbb{R}^2$.

(日) (日) (日) (日) (日) (日) (日)

Model misspecification – infinite horizon

Instead of modeling ${\mathcal Q}$ we consider a set of alternative market dynamics with uncertain drift:

$$\begin{cases} dS_t^0 &= r(Y_t)S_t^0 dt, \\ dS_t &= (b(Y_t) + \eta_{1,t}\sigma(Y_t))S_t dt + \sigma(Y_t)S_t dB_t^1, \\ dY_t &= (g(Y_t) + (\eta_{1,t}\rho + \eta_{2,t}\bar{\rho})a(Y_t)) dt + a(Y_t)(\rho dB_t^1 + \bar{\rho} dB_t^2). \end{cases}$$

Investor's wealth dynamics $(X_t^{\pi,c,\eta}, 0 \le t < +\infty)$ is given by:

 $dX_t = [r(Y_t)X_t + \pi_t(b(Y_t) - r(Y_t) + \eta_{1,t}\sigma(Y_t))]dt + \pi_t\sigma(Y_t)dB_t^1 - c_tdt,$

- π capital invested in risky asset,
- *c* consumption per unit of time.

Model misspecification – infinite horizon

Instead of modeling \mathcal{Q} we consider a set of alternative market dynamics with uncertain drift:

$$\begin{cases} dS_t^0 &= r(Y_t)S_t^0 dt, \\ dS_t &= (b(Y_t) + \eta_{1,t}\sigma(Y_t))S_t dt + \sigma(Y_t)S_t dB_t^1, \\ dY_t &= (g(Y_t) + (\eta_{1,t}\rho + \eta_{2,t}\bar{\rho})a(Y_t)) dt + a(Y_t)(\rho dB_t^1 + \bar{\rho} dB_t^2). \end{cases}$$

Investor's wealth dynamics $(X_t^{\pi,c,\eta}, 0 \le t < +\infty)$ is given by:

$$dX_t = [r(Y_t)X_t + \pi_t(b(Y_t) - r(Y_t) + \eta_{1,t}\sigma(Y_t))]dt + \pi_t\sigma(Y_t)dB_t^1 - c_tdt,$$

- π capital invested in risky asset,
- c consumption per unit of time.

Main problem

Objective function

$$\mathcal{J}^{\pi,c,\eta}(x,y) := \mathbb{E}_{x,y} \int_0^{\tau^{\pi,c,\eta}} e^{-wt} \frac{(c_t)^{\gamma}}{\gamma} dt. \quad 0 < \gamma < 1,$$

$$au^{\pi, \boldsymbol{c}, \eta} = \inf\{t \geq \boldsymbol{\mathsf{0}} : X^{\pi, \boldsymbol{c}, \eta}_t \leq \boldsymbol{\mathsf{0}}\}$$

Investor, who doubts his model, uses maxmin criterion:

$$\text{maximize } \inf_{\eta \in \mathcal{M}} \mathcal{J}^{\pi, \boldsymbol{c}, \eta}(\boldsymbol{x}, \boldsymbol{y}) \text{ over } (\pi, \boldsymbol{c}) \in \mathcal{A}_{\boldsymbol{x}, \boldsymbol{y}}.$$

 This can be considered as a zero sum stochastic differential game, where the investor is looking for a saddle point (π^{*}, c^{*}, η^{*}), that is

$$\mathcal{J}^{\pi, \boldsymbol{\mathcal{C}}, \eta^*} \leqslant \mathcal{J}^{\pi^*, \boldsymbol{\mathcal{C}}^*, \eta^*}(\boldsymbol{x}, \boldsymbol{y}) \leqslant \mathcal{J}^{\pi^*, \boldsymbol{\mathcal{C}}^*, \eta}(\boldsymbol{x}, \boldsymbol{y})$$

HJBI equation

Differential operator

$$\mathcal{L}^{\pi,c,\eta}V(x,y) = \frac{1}{2}a^{2}(y)V_{yy} + \frac{1}{2}\pi^{2}\sigma^{2}(y)V_{xx} + \rho\pi\sigma(y)a(y)V_{xy} + (\rho\eta_{1} + \bar{\rho}\eta_{2})a(y)V_{y} + g(y)V_{y} + \pi(b(y) - r(y) + \eta_{1}\sigma(y))V_{x} + r(y)xV_{x} - cV_{x}.$$

We have to solve

$$\max_{\pi \in \mathbb{R}} \max_{c>0} \min_{\eta \in \Gamma} (\mathcal{L}^{\pi,c,\eta} V - wV + \frac{c^{\gamma}}{\gamma}) \\ = \min_{\eta \in \Gamma} \max_{\pi \in \mathbb{R}} \max_{c>0} (\mathcal{L}^{\pi,c,\eta} - wV + \frac{c^{\gamma}}{\gamma}) = 0$$

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

HJBI equation

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○ のへで

Verification theorem, part I

Suppose there exists a function $V \in C^{2,2}((0, +\infty) \times \mathbb{R}) \cap C([0, +\infty) \times \mathbb{R})$ an admissible Markov control $(\pi^*(x, y), c^*(x, y), \eta^*(x, y))$ and constants $D_1, D_2 > 0$ such that

$$egin{aligned} \mathcal{L}^{\pi^*(x,y),c^*(x,y),\eta} V(x,y) &- wV(x,y) + rac{(c^*(x,y))^\gamma}{\gamma} \geq 0, \ \mathcal{L}^{\pi,c,\eta^*(x,y)} V(x,y) &- wV(x,y) + rac{c^\gamma}{\gamma} \leq 0, \ \mathcal{L}^{\pi^*(x,y),c^*(x,y),\eta^*(x,y)} V(x,y) &- wV(x,y) + rac{(c^*(x,y))^\gamma}{\gamma} = 0, \ D_1 x^\gamma &\leq (c^*(x,y))^\gamma, \ V(x,y) \leq D_2 x^\gamma \end{aligned}$$

for all $\eta \in \Gamma$, $(\pi, c) \in \mathbb{R} imes (0, +\infty)$, $(x, y) \in (0, +\infty) imes \mathbb{R}$

・ロト・日本・モート ヨー うへの

Verification theorem, part II

and

$$\tau_{\mathbf{X},\mathbf{y}}^{\pi^*,\mathbf{c}^*,\eta} = +\infty,,$$
$$\mathbb{E}_{\mathbf{X},\mathbf{y}}\left(\sup_{0 \le s \le t \land \tau} e^{-ws} |V(\mathbf{X}_s^{\pi,c,\eta}, \mathbf{Y}_s)|\right) < +\infty$$

for all $(x, y) \in (0, +\infty) \times \mathbb{R}$, $t \in [0, +\infty)$, $(\pi, c) \in \mathcal{A}$, $\eta \in \mathcal{M}$.

Then

$$\mathcal{J}^{\pi, c, \eta^*}(x, y) \leq V(x, y) \leq \mathcal{J}^{\pi^*, c^*, \eta}(x, y)$$

for all $\pi \in \mathcal{A}, \eta \in \mathcal{M},$

and

$$V(x,y) = \mathcal{J}^{\pi^*, \mathcal{C}^*, \eta^*}(x, y).$$

Saddle point derivation

 Applying standard minimax results we can reduce the task to solving only one equation:

$$\min_{\eta\in\Gamma}\max_{\pi\in\mathbb{R}}\max_{c>0}(\mathcal{L}^{\pi,c,\eta}V-wV+\frac{c^{\gamma}}{\gamma})=0,$$

• The maximum with respect to π and c is achieved at

$$\pi^*(x, y, \eta) = -\frac{\rho a(y)}{\sigma(y)} \frac{V_{xy}}{V_{xx}} - \frac{(b(y) + \eta_1 \sigma(y))}{\sigma^2(y)} \frac{V_x}{V_{xx}},$$
$$c^*(x, y) = \left(\frac{V_x}{\gamma}\right)^{\frac{1}{\gamma-1}}.$$

The following ansatz is made:

$$V(x,y) = \frac{x^{\gamma}}{\gamma}F(y)$$

・ロト・西ト・西ト・日下 ひゃぐ

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

Transformation of HJBI equation

After substitution and dividing by $\frac{x^{\gamma}}{\gamma}$ we get

$$\frac{1}{2}a^{2}(y)F_{yy} + \left[\frac{\rho^{2}\gamma}{2(1-\gamma)}a^{2}(y)\frac{F_{y}^{2}}{F}\right] + \left(g(y) + \frac{\rho\gamma}{1-\gamma}a(y)\lambda(y)\right)F_{y} + \min_{(\eta_{1},\eta_{2})\in\Gamma}\left(\bar{\rho}\eta_{2}a(y)F_{y} + \frac{\rho}{(1-\gamma)}a(y)\eta_{1}F_{y} + \frac{\gamma}{2(1-\gamma)}\left(\lambda(y) + \eta_{1}\right)^{2}F\right) + \gamma r(y)F + \left[(1-\gamma)F^{\frac{-\gamma}{1-\gamma}}\right] - wF = 0,$$
(2.1)

Transformation of HJBI equation

If there exist *F* solution to (2.1) and $m_1, m_2, R > 0$ such that

$$\left|rac{F_y}{F}
ight|\leq R \quad ext{and} \quad m_1\leq F^{rac{1}{\gamma-1}}\leq m_2,$$

then

$$\max_{q \in [-R,R]} \left(-Fq^2 + 2F_yq\right) = \frac{F_y^2}{F},$$
$$\max_{m_1 \le c \le m_2} \left(-\gamma cF + c^\gamma\right) = (1-\gamma)F^{\frac{-\gamma}{1-\gamma}}.$$

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

Transformation of HJBI equation

Therefore it is worth to consider

$$\frac{1}{2}a^{2}(y)F_{yy} + \max_{q \in [-R,R]} (-Fq^{2} + 2F_{y}q) + \min_{\eta \in \Gamma} \left(i(y,\eta)F_{y} + h(y,\eta)F\right) \\ + \max_{m_{1} \leq c \leq m_{2}} \left(-\gamma cF + c^{\gamma}\right) - wF = 0,$$

HJB equation

This equation can be generalized to

$$\frac{1}{2}a^{2}(y)u_{yy}+\max_{\eta\in D}\left(i(y,\eta)u_{y}+h(y,\eta)u\right)+\max_{c>0}\left(-\gamma cu+c^{\gamma}\right)-wu=0,$$

where $D \subset \mathbb{R}^n$ is a compact set.

Assumption 1

a, *h*, *i* are continuous functions, $a(y) > \varepsilon > 0$ and there exist constants $L_1 > 0$, $L_2 \ge 0$ such that

$$\begin{split} |h(y,\eta) - h(\bar{y},\eta)| + |i(y,\eta) - i(\bar{y},\eta)| &\leq L_1 |y - \bar{y}|, \\ |h(y,\eta)| + |a(y)|^2 &\leq L_1, \quad |i(y,\eta)| \leq L_1 (1 + |y|), \\ (y - \bar{y})(i(y,\eta) - i(\bar{y},\eta)) + |a(y) - a(\bar{y})|^2 &\leq L_2 |y - \bar{y}|^2. \end{split}$$

HJB equation

This equation can be generalized to

$$\frac{1}{2}a^{2}(y)u_{yy}+\max_{\eta\in D}\left(i(y,\eta)u_{y}+h(y,\eta)u\right)+\max_{c>0}\left(-\gamma cu+c^{\gamma}\right)-wu=0,$$

where $D \subset \mathbb{R}^n$ is a compact set.

Assumption 1

a, *h*, *i* are continuous functions, $a(y) > \varepsilon > 0$ and there exist constants $L_1 > 0$, $L_2 \ge 0$ such that

$$\begin{split} |h(y,\eta) - h(\bar{y},\eta)| + |i(y,\eta) - i(\bar{y},\eta)| &\leq L_1 |y - \bar{y}|, \\ |h(y,\eta)| + |a(y)|^2 &\leq L_1, \quad |i(y,\eta)| \leq L_1 (1 + |y|), \\ (y - \bar{y})(i(y,\eta) - i(\bar{y},\eta)) + |a(y) - a(\bar{y})|^2 &\leq L_2 |y - \bar{y}|^2. \end{split}$$

Existence and uniqueness

Theorem

Suppose that **Assumption 1** is satisfied with $L_1 > 0$, $L_2 \ge 0$ and $w > \sup_{\eta,y} h(y,\eta) + L_2$. Then there exists a unique bounded solution to

$$\frac{1}{2}a^{2}(y)u_{yy} + \max_{\eta \in D}(i(y,\eta)u_{y} + h(y,\eta)u) + \max_{m_{1} \leq c \leq m_{2}}(-\gamma cu + c^{\gamma}) - wu = 0,$$

which, in addition, has bounded y-derivative and is bounded away from zero.

(日) (日) (日) (日) (日) (日) (日)

Sketch of the proof

• Solution to infinite time HJB is approximated by solution to finite time horizon HJB of the form

$$u_t + \frac{1}{2}a^2(y)u_{yy} + \max_{\eta \in D}(i(y,\eta)u_y + h(y,\eta)u) + \max_{m_1 \le c \le m_2}(-\gamma cu + c^{\gamma}) - wu = 0,$$

with terminal condition u(y, T) = 0.

Rubio (2012) result ensures that under Assumtion 1 a unique bounded solution exists (u^T)
 Related results: Friedman (1973), Pham (2002)

Non-linearity recovering

 Using stochastic representation we can find m₁^{*}, m₂^{*}, R^{*} > 0 that

$$\max_{\substack{q\in [-R^*,R^*]}} (-F^*q^2 + 2F_y^*q) = \frac{(F_y^*)^2}{F^*},$$
$$\max_{m_1 \le c \le m_2} \left(-\gamma cF^* + c^{\gamma}\right) = (1-\gamma)(F^*)^{\frac{-\gamma}{1-\gamma}},$$

where $F^* = F^{m_1^*, m_2^*, R^*}$

This implies that F* is a solution to

$$\frac{1}{2}a^{2}(y)F_{yy} + \frac{\rho^{2}\gamma}{2(1-\gamma)}a^{2}(y)\frac{F_{y}^{2}}{F} + \max_{\eta\in D}(i(y,\eta)F_{y} + h(y,\eta)F) + (1-\gamma)F^{\frac{-\gamma}{1-\gamma}} - wF = 0.$$
(4.1)

final result

Theorem

Suppose that a, g, r, λ are Lipschitz continuous functions, a, λ , r are bounded and $a(y) > \varepsilon > 0$, g is of linear growth, w > sup_{η,y} $h(y,\eta) + L_2$. Then there exists a saddle point $(\pi^*(x,y), c^*(x,y), \eta^*(x,y))$ such that

$$\pi^*(x,y) = \frac{\rho a(y)x}{(1-\gamma)\sigma(y)} \frac{F_y}{F} + \frac{(\lambda(y) + \eta_1^*(y))x}{(1-\gamma)\sigma(y)}, \quad c^*(x,y) := \left(\frac{F}{\gamma}\right)^{\frac{1}{\gamma-1}} x$$

where *F* is a bounded together with *y*-derivative and bounded away from zero solution to (4.1). η^* is a Borel measurable function which realizes maximum in (4.1).
